**DAVID J. GABEL  
QUEENS COLLEGE**

**AND**

**INTERNET AND TELECOMMUNICATIONS  
CONVERGENCE CONSORTIUM  
MASSACHUSETTS INSTITUTE OF TECHNOLOGY**

**PRESENTED AT**

*The Future of Broadband: Wired and Wireless?*

**University of FLORIDA**

**February 24, 2005**

# Section 254(b) Principles

1. The provision of high quality service;
2. Reasonable and affordable prices for consumers;
3. Access to advanced services in all regions of the nation;
4. Consumers in rural and high cost areas have access to all telecommunications services that are provided in urban areas at reasonably comparable rates;
5. Providers of telecommunications services make equitable and nondiscriminatory contributions to the preservation and advancement of universal service;
6. Specific, predictable, and sufficient federal and state mechanisms to preserve and advance universal service; and
7. Universal service support mechanisms and rules that are competitively neutral.

# Types of Universal Service Funds

1. Low-income support: In 1984, the Commission established a Lifeline program to promote universal service by providing low-income individuals with discounts on the monthly cost of telephone service. Since then, the Commission has expanded the rules to help low-income households pay the initial costs of commencing service, and expand the federal default eligibility criteria to include an income-based criterion and additional means-tested programs.
2. High-cost support: “The high-cost support mechanisms enable areas with very high costs to recover some of these costs from the federal universal service support mechanisms, leaving a smaller remainder of the costs to be recovered through end-user rates or state universal service support mechanisms. In this manner, the high-cost support mechanisms are intended to hold down rates and thereby further one of the most important goals of federal and state regulation the preservation and advancement of universal telephone service.”
3. Schools and libraries support: “Eligible schools, school districts, and libraries, may receive discounts of 20-90% for eligible telecommunications services, voicemail, Internet access, and internal connections under the schools and libraries universal service support mechanism.”
4. Rural health care support: The 1996 Act requires telecommunications carriers to provide telecommunications services to public or non-profit health care providers at rates comparable to those charged for similar services. The Commission's universal service rules also permit eligible health care providers to receive support for any telecommunications service.

# States' Federal Filing Requirements

“...states should be required to file annual certifications with the Commission to ensure that carriers use universal service support “only for the provision, maintenance and upgrading of facilities and services for which the support is intended” consistent with section 254(e).”

# FCC Suggestions as to How Universal Service Funds Could be Used by States

“...a state could adjust intrastate rates, or otherwise direct carriers to use the federal support to replace implicit intrastate universal service support to high-cost rural areas, which was formerly generated by above-cost rates in low-cost urban areas, that has been eroded through competition. A state could also require carriers to use the federal support to upgrade facilities in rural areas to ensure that services provided in those areas are reasonably comparable to services provided in urban areas of the state. These examples are intended to be illustrative, not exhaustive. As long as the uses prescribed by the state are consistent with section 254(e), we believe that the states should have the flexibility to decide how carriers use support provided by the federal mechanism.”

## Descriptive Statistics and Definitions of Variable

Variable	Definition	Obs	Mean	Std. Dev.	Min	Max

# USF Findings

- Data analysis indicates that USF money is not being used to upgrade the facilities.
- Results do not change if I use HCPM loop cost estimates.
- What does work? Evaluation of packet-switching.
